

Clean Air? We Can Do It: **When you stop,** **Turn your engine off!**

Shutting off your engine for even **30 seconds** (when not in traffic) rather than idling will save fuel, fight climate change, and help keep our air clean.

Cars built since the late 1980s have fuel-injection systems rather than carburetors and use less fuel restarting than even 10 seconds of idling.

Ford Motor Company recommends drivers "turn the engine off when stopped for more than 30 seconds to save fuel and reduce exhaust emission," whereas "frequent restarting has little impact on components that include the battery and starter motor."

Visit www.EnginesOff.com for more information.

Engines **OFF!**
